Question Bank

1	Evaluate how AWS Regions, Availability Zones, and Edge Locations contribute to application reliability and disaster recovery.	CO 1
2	Describe the cloud computing architecture and explain its major components with a relevant sketch.	CO 1
3	Discuss the concept of elasticity and scalability in cloud environments.	CO 1
4	Compare SaaS, IaaS, and PaaS models. Discuss their pros, cons, and business applicability with examples.	CO 1
5	List and explain the five essential characteristics of cloud computing.	CO 1
6	Explain the deployment and service models in cloud computing with suitable examples.	CO 1
7	Your application needs high-speed storage. Which EBS volume type would you choose and why? Explain the role of EBS snapshots.	CO 2
8	Compare Amazon S3 and Amazon EFS in terms of architecture and usage.	CO 2
9	Describe the lifecycle of an EC2 instance and outline the steps to manage snapshots.	CO 2
10	How does Auto Scaling enhance application performance and reliability in AWS?	CO 2
11	Explain the benefits of using AWS Local Zones for latency-sensitive applications.	CO 2
12	Describe the process of launching and connecting to an EC2 instance. Justify your selected instance type and connection method.	CO 2
13	Demonstrate the deployment of a website using AWS Elastic Beanstalk and illustrate the architecture 'myapp.us east-1.elasticbeanstalk.com'	CO 2
14	What is Amazon Route 53? How does it implement routing policies for directing traffic? Create a failover architecture for 'www.myperonsalwebsite.com'	CO 3
15	How do IAM roles differ from IAM users? Provide a real-world scenario for IAM usage.	CO 3
16	Evaluate how security groups and NACLs differ in AWS VPC configuration.	CO 3
17	How does Amazon KMS enhance data protection?	CO 3
18	Compare AWS Lambda and AWS Fargate architectures. Suggest a suitable scenario for each.	CO 3
19	Explain AWS API Gateway and discuss the functions of any three commonly used APIs.	CO 3
20	Describe the Shared Responsibility Model and explain its importance.	CO 3
2	Outline the process of creating a DynamoDB table. Explain the importance of the partition and sort keys.	CO

1		4
22	Explain the use of CloudWatch for monitoring DynamoDB and RDS performance.	CO 4
23	Describe the steps involved in setting up an Amazon RDS instance. Include a relevant real-world example.	CO 4
24	Discuss the use of Load Balancers in AWS and their types.	CO 4
25	Describe how CloudTrail and CloudWatch support AWS governance.	CO 4
26	Explain how AWS CDK helps implement infrastructure as code. Provide a code snippet to create an S3 bucket.	CO 4
27	What is Amazon Redshift? Compare it with RDS in terms of analytics capabilities.	CO 4
28	Reflect on the role of AWS services in building scalable and cost-effective applications across all five modules.	CO 5
29	Compare cost implications between Reserved Instances and On-Demand EC2 pricing models.	CO 5
30	Describe the role of AWS Step Functions in workflow orchestration. Provide an example state machine.	CO 5
31	Explain the features of AWS Budgets and Cost Explorer. Demonstrate how to configure a budget and interpret cost data.	CO 5
32	What is Amazon SNS and SQS? How can they work together in an architecture?	CO 5
33	Illustrate the role of tags in organizing AWS resources and budgets.	CO 5
34	Explain the working of AWS Billing Conductor and AWS Marketplace.	CO 5
35	Analyze the benefits of using CI/CD with AWS CodePipeline and Beanstalk.	CO 5
